

Fibre Broadband

Access the UK's next generation fibre network, offering faster download and upload speeds, reliable connectivity and consistently better performance for your business than a standard ADSL broadband connection.

How Fibre broadband works

We use FTTC (Fibre to the Cabinet) connections to provide the fastest mass-market download and upload speeds available throughout the UK. Fibre optic cables link your local exchange to the cabinet in your street. The connection between the street cabinet and your premises is copper (as with an ADSL broadband connection), and as copper performs well over short distances, you won't experience any degradation in performance.

We'll make sure you get everything you need for your FTTC connection and will manage the equipment installation every step of the way.

How Fibre broadband benefit your business

Increased productivity	Our fully unmetered Business Fibre service is the perfect solution if you have a number of users regularly transferring large amounts of data, accessing hosted cloud applications or using VoIP/video conferencing services. Our dynamic Traffic Management policy also ensures that your business critical applications are given the highest priority over our network.
Host multiple users	The more users you have, the more bandwidth you need, and where standard ADSL connections can struggle to cope with a high number of users across one site, our Fibre Broadband services provide fast download and upload speeds to cater for businesses and demands of varying sizes.
UK-based support	Dedicated account management and completely unscripted customer and technical support.
